(54) ORGANIC ELECTRIC FIELD LIGHT EMITTING ELEMENT

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a long-life and highly reliable element with excellent color conversion efficiency by using at least one compound selected from straight silicone resin compounds and modified silicone resin compounds for a protective layer for the light emitting element.

SOLUTION: A fluorescent pigment layer is formed by arranging a red pigment layer 3, a green pigment layer 4, or a blue pigment layer 5 on a base such as a glass board 6. On the fluorescent pigment layer, protective layers 1, 2, a positive electrode 7, a positive hole injection layer 8, a positive hole carrying layer 9, an organic light emitting layer 10, an electron injection layer 11, and a negative electrode 12 are arranged in this order. As the protective layers 1, 2, a mechanically strong transparent silicone resin having a film thickness of about 1-20 μm and a gas barrier characteristic is laminated on a color conversion filter consisting of the respective pigment layers 3, 4, 5. The silicone resin is cured at about 150°C or less, and the silicone resin layer may be formed into a single layer. In this case, the protective layers 1, 2 have the same

composition. On the protective layers 1, 2, a film of an insulative inorganic oxide such as silicon oxide or aluminum oxide may be formed.
